                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   BLOCKERN. BLODMYS. Res. COMMUN. 190:681-687(1993).

- 1- FUNCTION: COMPONENT OF THE BACTERICIDAL RA-REACTIVE FACTOR RARF WHICH SPECIFICALLY BINDS TO RA AND R2 POLYSACCHARIDES EXPRESSED BY CERTAIN ENTERCHAELTS THE ACTIVATION OF COMPLEMENT CASCADE BY ACTIVATING THE C4 AND C2 COMPONENTS. IT ACTIVATES THE C4 COMPONENT BY CLEATING THE C4 COMPONENTS. IT ACTIVATING COMPONENT.

- 1- SUBJUNT: RARF CONSISTS OF A COMPLEMENT-ACTIVATING COMPONENT.

- 1- SUBJUNT: RARF CONSISTS OF A COMPLEMENT-ACTIVATING COMPONENT.

- CRARF IS AN HETERODIMER OF A HEAVY (P70) AND A LIGH CHAIN (29)

- 1- INKED BY A DISULPIDE BOND.

- 1- TISSUE SPECIFICITY: LIVER.

- 1- DOMAIN: CRARF HAS A MODULE ORGANIZATION SIMILAR TO CIR AND CIS.

- 1- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1.

- 1- SIMILARITY: CONTAINS 2 USB DOMAINS.

- 1- SIMILARITY: CONTAINS 2 USB DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. FUNCTION: THIS ENZYME IS CLOSELY ASSOCIATED WITH AN ENDOTOXIN-SENSITIVE HEMOLYMPH COAGULATION SYSTEM WHICH MAY PLAY IMPORTANT ROLES IN BOTH HEMOSTASIS AND HOST DEFENSE MECHANISMS. ITS ACTIVE FORM CATALIZES THE ACTIVATION OF FACTOR B. CATALYTIC ACTIVITY: Selective cleavage of 103-Arg-|-Ser-104 and 124-IIe-|-I1e-125 bonds in Limulus clotting factor B to form activated factor B. Cleavage of Pro-Arg-|-Xaa bonds in synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              HEAVY CHAIN.

"A comparative study of partial primary structures of the catalytic region of mammalian protein C.";
Br. J. Haematol. 86:590-600(1994).
-! FUNCTION: PROTEIN C IS A VITAMIN K-DEPENDENT SERINE PROTEASE THAT REGULATES BLOOD COAGULATION BY INACTIVATING FACTORS VA AND VIIIA.
IN THE PRESENCE OF CALCIUM IONS AND PHOSPHOLIPIDS.
-!- CATALITIC ACTIVITY: Degradation of blood coagulation factors Va
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Stimulating growth and repair of cartilage, useful for treating e.g. arthritis, by local administration of an agonist of non-proteolytically activated thrombin receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of stimulating growth and repair of cartilage. The method involves administering to the site, an agonist of non-proteolytically activated thronain receptor (MRRA). The method is used in human or veterinary medicine for the treatment of arthritic joints and damage/loss of cartilage caused by traumatic injury. Also chondrocytes may be cultured in presence of NPAR agonist to provide cells for implantation at sites requiring growth/repair of cartilage. The present sequence is human thrombin peptide. The derivatives of thrombin peptide which serves as a NPAR agonist.
                                                                                                                                                                                                                                                                                                                                                       therapy; implantation; thrombin peptide; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bergmann J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                              ò
                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel ligands which bind to transport molecules, comprising a therapeutic and/or diagnostic agent (A) non-covalently bonded via a linkage cleavable in vivo depending on pH and/or enzymatically with a substance (B) having an association constant KA to a transport molecule of above 10~3 M^-~1, is new. The medicaments are especially useful for the treatment of cancers, autoImmune diseases, acute and chronic inflammation and infections caused by viruses or microorganisms. The diagnostic kits are useful for the detection of the transport molecule and/or its distribution in vivo. The ligands have excellent solubility in the medium at the site of action are easy and inexpensive to covert into adducts, as the interaction with the transport material is physical.
                                                                                                                                                                                                                                                               Gaps
                                                      The sequences given in AAR25311-19 are cyclic peptides which act as contact inhibitors of animal cells. They are resistant to decomposition by hydrolytic enzymes and can be maintained at high lavels of activity for a long period in vivo. The peptides are cyclic and may have 1-16 pref. 1-4 amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Transport molecule; ligand; cancer treatment; autoimmune disease; inflammation; infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New ligand, comprising therapeutic or diagnostic agent bonded non-covalently with substance having high affinity to transport
                                                                                                                                                                                                                                                             ö

Carney DH,

```
The present sequence is that of a thrombin receptor binding domain peptide that is used in a claimed method for promoting cardiac peptide that is used in a claimed method for promoting cardiac tissue repair. The method involves administering an angiogenic thrombin derived peptide. The peptide comparises the present thrombin receptor binding domain together with a scrine esterase conserved sequence (see AAM50857), or preferably a peptide (see AAM50858) which includes both these sequences. The thrombin-derived peptide is administered during or following cardiac surgery by injection into cardiac tissue, and may be formulated as a sustained release formulation. It is used in claimed methods of stimulating revascularisation, stimulating vascular occlusion, and inhibiting restencial peptide may be coated onto the catheter.
                                                                                                                                             Promoting cardiac tissue repair, stimulating revascularisation, stimulating vascular endothelial cell proliferation, and inhibiting vascular occlusion by using anglogenic thrombin derivative peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         peptides which are useful
have higher activity than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide(s) comprising arginine-glycine-asparagine and hyaluronic acid - useful as platelet antagonists with higher activity than arginine-glycine-asparagine-valine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100.0%; Score 21; DB 23;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a method of stimulating bone growth at a site in a subject in need of osteoinduction. The method involves administering an agonist to stimulate bone growth at a site in a subject (e.g. a farm animal, companion animal or laboratory animal), in need of osteoinduction, such as the site in need of a bone graft in a subject, a segmental bone gap, a bone void or a non-union fracture. This sequence represents a thrombin peptide derivative obtained from a serine esterase that can stimulate or activate the non-proteolytically
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Stimulating bone growth at a site in a subject in need of osteoinduction, such as a site of bone graft, segmental bone gap, bone void or non-union structure, by administering agonist of activated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PXPXPXXXXXX
    human immunodeficiency virus (HIV) by treating the virus, or its target cell, with a thrombospondin or thrombospondin analogue. Thrombospondin blocks binding of HIV to its cellular receptors. Thrombospondin or its analogues can used to prevent infection by HIV, in both contraceptive and non-contraceptive compositions/devices. They are already known to reduce infectivity of some bacteria and protozoa. The present sequence represents a human thrombospondin-1 type III repeat peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method for suppressing infectivity of human immunodeficiency virus (HIV) by treating the virus, or its target

The present invention relates to a method for inhibiting thrombin cartivation in a human cell expressing protease activated receptor 1 (PARI). The method involves using peptides (e.g. the present peptide) that inhibit platelet activation. The method is useful for preventing thrombosis and platelet aggregation. The method can be used for patients with acute coronary syndromes (e.g. cresendo anglan, myccardial infarction) and for individuals who have acute coronary syndromes and receive percutaneous transluminal coronary angioplasty with an artificle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            activated receptor 1 (PAR1), comprises contacting mixtures of thrombi
and human cell expressing PAR1, with a peptide that inhibits platelet

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (II) comprising (I); (2) a polypencientide (III) encoding (I) or (II); and (S3) designing (M) (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5-most position of the subsite. (I) is useful in studying gene function, and for human therapeutics and plant engineering. (I), (II) or (III) is useful in therapeutic methods to modulate the expression of a target region within
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to
                         locally such as in the case of an operation performed in the peritoneal cavity, to prevent adhesions and scar formations locally as in the case of eye operations, for prophylactic inhibiton of E. coll binding to epithelial cells of the urhary tract or intestine, diagnosis and treatment of E. coll related infections, and identification of various pathogenic bacterial strains. The peptide is pref. prepd. by solid phase synthesis.
peptide can be used for eg mobilisation of bone marrow cells; prevention and reversal of attachment of disseminated tumour cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zinc finger protein; ZFP; DNA binding protein; zinc finger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Zinc finger protein related peptide motif SEQ ID NO:289.
                                                                                                                                                                                                         100.0%; Score 21; DB 12; 100.0%; Pred. No. 7.8e+05;

                                                                                                                                              Synthetic peptide(s) from fibronectin- used in control of cell attachment
                                                                                                                                                                                                                        This polypeptide mediates the attachment of animal cells to substrates. The substrate (I) is contacted with cells and with a soln. contg. this polypeptide. This attachment can be prevented in addition to detaching the cells from (I) once attached. Applications are in eg fermentation, cell line prepn., diagnosis and therapy.
                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The peptide, or shorter versions contg. the RGD active site from fibronectin, can be used to prevent and reverse attachment of cells to substrates. This can be used in cell prodn., fermentation, cell line prepn., cell matrix prodn., diagnostics and therapy. The

```
The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) a target site, comprising a first (FI), a second (F2), and a third (F3) to carry first (FI), a second (F3), a second 
                                                                                                                                                                                                                                                                                                                                               ö
a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced biological activity. ABQ71213 to ABQ72214 and ABP46191 to ABP51230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to

The present invention describes a zinc finger protein (1) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) zinc finger, comprising a first (F1), a second (F2), and a third (F3) zinc finger site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (II) comprising (I): (2) a polynucleotide (III) encoding (I) or (III); and (S) dealgning (M) (I) involves selecting the F1 zinc finger such that the binds to the S1 target subsite, and selecting the F3 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S2 target subsite, thus designing (I) carget subsites having the nucleotide (II) is useful for recognition of the capacitate and plant engineering. (I), (II) or (III) is useful in the properties and plant engineering. (I), (II) or (III) is useful in the capacitic detection of a subject, and alarget region within a subject, and a subject, and a subject and in assays to determine the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and specificity for their target sequences, as well as enhanced biological activity, A8071213 to A8072131 and ABP48191 to ABP51230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present invention.
                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   phenotype and function of gene expression. (i) has improved affinity and specificity for their target sequences, as well as enhanced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New zinc finger protein that binds to target site, useful in stugene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (SI), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) comprising (II); (2) a polypuclectide (III) encoding (I) or (III); and (I) or (III) and (I) or (III) and (I) or (III) and (I) or (III) and (I) designing (M) (I) involves selecting the F2 zinc finger such that it binds to the S1 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites having the nuclectide G in the 5'-most position of the capter subsite. (I) is useful in studying gene function, and for human therapeutics and plant engineering. (I) (II) or (III) is useful in the property of the captered of a target region within
                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (II); and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                 (without alignments)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 100, Application US/09139762A
Patent No. 6013453
GENERAL INFORMATION:
APPLICANT: Choo, Yen
APPLICANT: Klug, Aaron
APPLICANT: Sanchez Garcia, Isidro
TITLE OF INVENTION: Improvements in or Relating to
TITLE OF INVENTION: Binding Proteins for Recognition of DNA
NUMBER OF SEQUENCES: 125
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 21; DB 1; Length 10; 100.0%; Pred. Patent No. 6140072
GENERAL INFORMATION
GENERAL INFORMATION:
APPLICANT: Cappello, Joseph
TITLE OF INVENTION: Functional Recombinantly Prepared
TITLE OF INVENTION: Synthetic Protein Polymer
NUMBER OF SEQUENCES: 119
CORRESPONDENCE ADDRESS:

"Structure of the RGD protein decorain: conserved motif and distinct function in leech proteins that affect blood clotting.";

Science 264:1944-1947(1994).

-I- FUNCTION: INHIBITS FIBRINOGEN INTERACTION WITH PLATELET RECEPTORS EXPRESSED ON GIYCOPROTEIN IIB-IITA COMPLEX. MAY PREVENT BLOOD FROM CLOTTING DURING EITHER FEEDING AND/OR STORAGE OF INGESTED BLOOD.

-I- SIMILARITY: HIGH, TO P.ORNATA ORNATINS.

-I- SIMILARITY: SOME, TO THE DISINTEGRIN FAMILY.
